ProDeed System

The Register of Deeds environment is surrounded by mission critical documentation that must be recorded, indexed and archived in a timely manner. Patrons depend on the Register of Deeds to house the recorded information and have it readily available with easy access and limited expense.

With this in mind, BizTech Solutions Inc. has created the ProDeed System. The ProDeed System is a collaboration of products BizTech Solutions offers including ProCapture, ProGateway, and ProDMS to enable us to offer the Register of Deeds a unique product tailored to their specific requirements and streamline the entire collection of document handling processes into one automated process.

Features

The BizTech Solutions Inc. ProDeed System is...

1. An integrated hardware and software solution, designed specifically for the Register of Deeds environment, used for building and managing electronic document archives.
2. Suitable for organizing any document collection that can be characterized as having a two-tier, hierarchical index structure (e.g. Book and Page, Roll and Frame, Cabinet and Slide Number, etc.).
3. A solution for enabling document handling processes into one automated process- in a single pass. An operator can digitally capture a document image that can then be printed to paper, copied to microfilm, faxed, or e-mailed as necessary.
4. A system that can operate in a number of configurations. At its simplest, it can consist of a single scan station (computer, scanner and printer) used to capture document images and copy them to CD media. Or, it can reside on an image server connected to a network with public retrieval stations which can provide the capability for instant retrieval of documents as they are scanned into the system.

Benefits

1. ProDeeds provides a streamlined production scanning environment, customized for the County records management environment. It includes interfaces to standard TWAIN, ISIS, and Kofax scan sources, as well as to a proprietary API for Contex and Oce engineering scanners (for scanning large-format documents, such as maps).
2. ProDeeds provides basic image enhancement functions like auto-cropping, auto-deskew, blank duplex page detection, etc.
3. ProDeeds provides separate Windows and Web based modules for public retrieval.
4. ProDeeds provides many special retrieval modules including support for print-accelerator cards, certification template printing, and interfaces for debit-card terminals (for unattended kiosk operation).
5. Document images are converted on-the-fly from TIFF to PDF for delivery to the browser in the ProWeb retrieval license.
